

Equipment Preservation

We Have Our Problem SolvedNow Let's Keep It That Way – Solved!

DasNet Corporation performs Operations and Maintenance (O&M) services for a variety of organizations worldwide ranging from the United States Air Force's base switch operations (Nortel DMS-100 and AT&T Definity G3i), or AT&T's international voice network), to foreign Postal Telephone & Telegraph (PTT) satellite facilities. DasNet provides fully trained technicians who are knowledgeable on and possess the requisite experience for operating, installing, configuring, repairing and managing the specific telecommunications infrastructure systems and equipment on each project.

How well a facility, network, or its supporting equipment operates is interdependent on how well it is maintained. Operation & Maintenance (O&M) is a critical tool in maintaining mission critical systems and should be entrusted to those with the applicable knowledge, experience, and commitment.

It is this experience and expertise that decreases the amount of scheduled or unscheduled downtime experienced by the client, increases system reliability and network dependability, extends equipment longevity, and enhances desired efficiency.

DasNet has outlined, within its Quality Assurance Program, key principles and guidelines that all project managers; installation, integration, and quality control engineers; and O&M technicians are expected to comply with. Site-specific details and customer requirements supplied during the Documentation and Analysis portion of the System Certification Phase provide further significant supplements.
